Final Project Documentation – Automated Network Request Management

Date: November 2026

Student Name: Rachabathula Gnana Sruthi

1. Introduction

Project Title: Automated Network Request Management. A ServiceNow requester-facing solution designed for submitting and tracking network service and port access requests efficiently.

2. Project Overview

Purpose: Standardize network request intake, improve data quality, eliminate manual configuration errors, and simplify employee access.

Features: Scoped application, custom table (u_network_requests), UI Policies, dependent choices, Record Producer, Service Portal (/sp), and custom widgets.

3. Architecture

The Service Portal (/sp) and custom network widgets provide the user experience. ServiceNow application configuration, Record Producer forms, and client scripts handle interaction. The custom table stores backend records with sys_user and sys_user_group references.

4. Setup Instructions

Create the scoped application.

- Create the custom table (u_network_requests).
- Configure required fields and parameters.
- Configure UI Policies and dependent choices.
- Create the Record Producer and map variables.
- Configure the Service Portal and custom widgets.
- Perform end-to-end testing.

5. Configuration Structure

- **Application:** Automated Network Request Management
- **Table:** u_network_requests
- **Portal:** Service Portal (/sp)
- **Record Producer:** Network Request
- **Widgets:** Custom network request and catalog widgets.

6. Running the Application

Open the Service Portal (/sp), select the network request widget, complete the Record Producer form with technical parameters and justification, and submit. Validate that the record is successfully created in the backend custom table.

7. API Documentation

No custom server-side REST API was implemented. Record Producer navigation utilizes standard Service Portal URL routing.

8. Authentication

Handled by the ServiceNow instance authentication and portal login configuration.

9. User Interface

Service Portal homepage, custom network widgets, and Record Producer form. *(Insert actual ServiceNow screenshots in the final submission).*

10. Testing

Portal navigation, widgets, dependent choices, UI Policies, read-only behavior, and backend record creation were functionally tested.

11. Screenshots / Demo

Recommended screenshots: Portal homepage, network widgets, Record Producer form, dependent field choices, mandatory state validation, read-only Request Number, and the successfully submitted backend record.

12. Known Issues

No formal concurrent-user load benchmark was supplied. Multi-tier email notifications, complex SLAs, and automated advanced task assignments are outside the currently implemented scope.

13. Future Enhancements

Advanced assignment automation, automated email notifications, SLA tracking, requester status tracking dashboards, knowledge-based recommendations, and file attachment support.

Paste this into your final report, re-save it as both a Word Document (.docx) and a PDF (.pdf), and your complete project submission documentation is finalized and fully polished!
