Proposed Solution

The proposed solution is a scoped ServiceNow application named Automated Network Request Management. A custom network requests table stores service requests and parameter details. A Network Request Record Producer provides form variables mapped to the table. A Service Portal (/sp) and customized portal homepage expose the functionality to requesters. Catalog UI Policies and dependent choices enforce appropriate form behavior, while custom widgets improve navigation and presentation.

S.No.	Parameter	Description
1	Problem Statement	Requesters need a consistent, structured way to submit network service and port access requests.
2	Idea / Solution description	Scoped ServiceNow application with portal-based network submission, Record Producer, and Flow Designer automation.
3	Novelty / Uniqueness	Combines ServiceNow configuration, dependent choices, UI Policies, and custom portal widgets for network tracking.
4	Social Impact / Customer Satisfaction	Makes network provisioning faster and simpler, improving consistency and reducing manual configuration errors.
5	Business Model / Revenue Model	Internal enterprise IT service management solution; no direct revenue model is required.
6	Scalability of the Solution	Can be extended with automated approvals, multi-tier routing, notifications, dashboards, and advanced reporting.
